

Project Design Phase Proposed Solution Template

Date	04 July 2026
Team ID	
Project Name	Plugging into the Future: An Exploration of Electricity Consumption Patterns
Maximum Marks	2 Marks

S.No.	Parameter	Description
1.	Problem Statement (Problem to be solved)	Analysts and planners lack an accessible way to see how India's state-wise electricity consumption shifted from 2019 to 2020 — including the COVID-19 lockdown's impact and the uneven pace of recovery across states — without spending hours manually processing raw spreadsheets.
2.	Idea / Solution description	An interactive Tableau dashboard and guided story built from the state-wise consumption dataset (Jan 2019–Dec 2020) that visualizes the national trend shift, regional variation across NR/SR/ER/WR/NER, and the pace of post-lockdown recovery by state — enabling analysts to explore and share insights easily.
3.	Novelty / Uniqueness	Combines all three analytical lenses — overall trend, regional comparison, and recovery pace — into one connected Tableau story rather than three separate ad-hoc reports; a calculated lockdown-period flag makes before/during/after comparisons a single click instead of a manual re-filter.
4.	Social Impact / Customer Satisfaction	Helps policymakers make faster, better-informed decisions about energy planning and post-crisis recovery, and gives analysts a reusable template for future crisis-impact analysis rather than rebuilding reports from scratch each time.
5.	Business Model (Revenue Model)	Delivered as an analytics consulting deliverable to state electricity boards and energy ministries; alternatively published as an open dashboard on Tableau Public to build public trust and transparency around energy planning.
6.	Scalability of the Solution	The workbook's extract-based structure and calculated fields (lockdown flag, YoY growth, recovery rate) can be extended to new years of data or additional states and regions without rebuilding the analysis from scratch.
